E-commerce Platform for a Cosmetics company

- Need to be designed and developed using the Salesforce platform.
- Online Shopping experience can be implemented using Salesforce.

Purpose

The purpose of this document is to outline the requirements for developing an online cosmetic shop using Salesforce Experience Cloud OR Salesforce Site. This system aims to provide a seamless shopping experience, enhance customer engagement, and improve management of Products.

Stakeholders

- Sales Manager

- Sales Team

- Customers

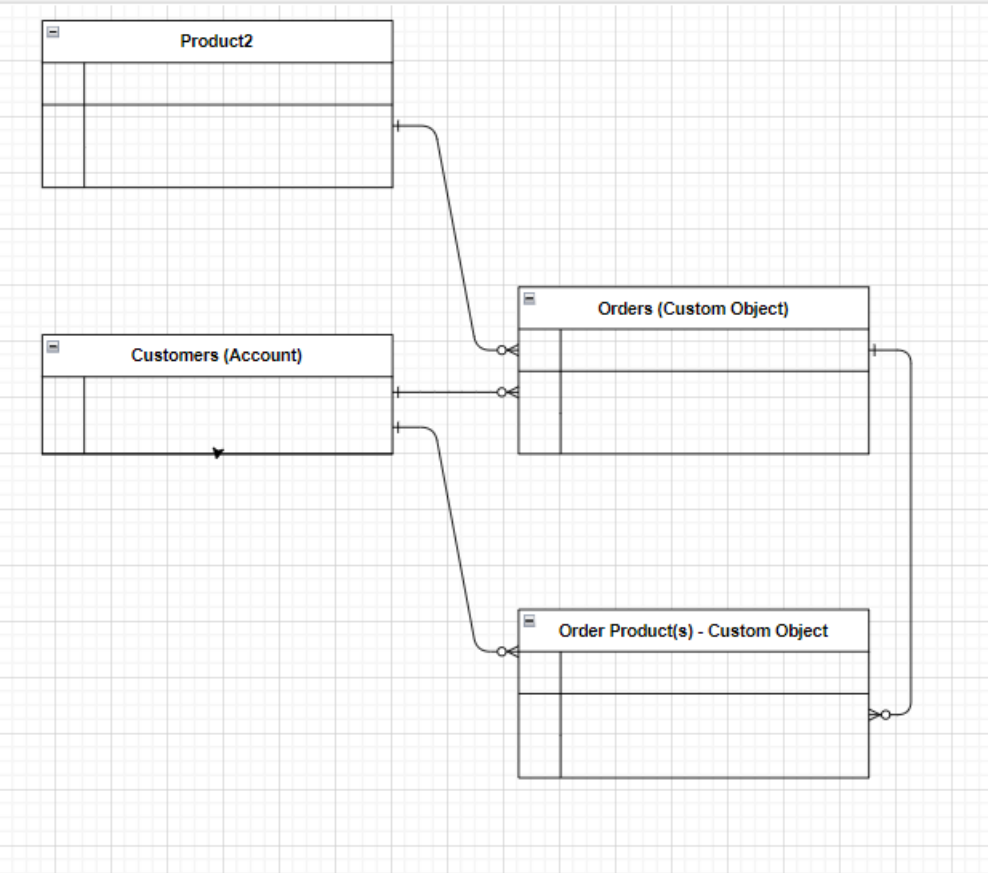

Objectives

- To create a user-friendly online shopping platform for customers.

- To provide a personalized shopping experience based on customer preferences.

- To streamline product management and inventory.

ERD

Pre-Requisites before starting

Salesforce CLI

VS Code to be installed

Salesforce extension on VS Code --> pls add

Salesforce Extraction Package

Latest Java version

Completion of the LWC Learnings via Degreed.

Working Developer Edition org with the above data model implemented.

Requirements

Story 1: Product management by internal users

Maintain a detailed product catalog with descriptions, images, prices, and availability (No. of Items Available in stock to Order). Available to Internal SF Users only.

Tech Advice:

Use the record page to add, update or delete products in catalog.

Suggestion - for extra practice LWC component can be created for this functionality

Story 2: Customer Engagement and Product Catalog

Tech Advice:

Create a salesforce tab which can be used by the customers. Ensure that this tab is accessible by everyone.

New LWC based screens to be created for the below and exposed on the tab:

- Add customer information (which will create an Account record in backend).
- Show Products catalog with title, category and image,
- on clicking expanded to show detail description
- Show buttons “Buy Now”, “Add to Cart” and label for “Out of Stock” in red (depending on the availability field from product) for every product
- If Out of Stock, disable “Buy Now” and “Add to Cart” button
- Product Search and Filtering: Implement search functionality with filters (e.g., product name, category, price range, brand).

Story 3: Cart Creation & Checkout

Allow users to add products to a Cart and submit for Order creation.

Tech Advice:

LWC based implementation for the below:

- Shopping Cart to be made available for customers to add, update quantity, and remove products from the cart.
- **when Customer adds items to the cart, if cart quantity exceeds stock, show error "Insufficient stock available." Prevent checkout if stock is insufficient.**
- Checkout Process: Provide a streamlined, user-friendly checkout process, including shipping and payment options (Cash only).
- Create Order upon checkout with added products from the shopping cart (Order related to Customer i.e. Account Record) and reduce the stock quantity from the product record.
- Once done show Order Confirmation: Show order confirmation popup with order details and button to navigate to order page.
